LOCAL AI FILM STUDIO

bitGen Studio

Your whole AI film studio - on your own computer.

Write it, cast it, render it, score it, cut it. Video, pictures, music and editing in one window, driven by the models on your own machine. Your ideas and your files stay yours.

100% local · ComfyUI inside · Video · Image · Music · Edit · One window, every step

The image editor - layers, masks, styles and filters, with AI fill, edit, Compose and Segment Anything built in.

VIDEO

MiniMax H3 · Wan 2.1 / 2.2 · LTX 2.5

scenes, characters, voices, swaps, VR worlds

PICTURES

Qwen Image · FLUX · SDXL and more

styles, LoRAs, ControlNet, face fix, editing

SOUND

songs · covers · stems · SFX

lyrics, karaoke, lip-sync, music videos

WHAT IT DOES

Everything a film needs

Scene board & screenplay

Ask the local LLM for a screenplay; it writes the scenes. Characters, voices and 360° locations stay the same from scene to scene. Every card shows its take, "rendering step n of total" and a scene picker keeps the board tidy.

Your video models

MiniMax H3 (references, first / last frame, text), Wan 2.1 and 2.2 - subjects that follow a path you draw - and LTX 2.5, all through your own ComfyUI. Append or prepend a clip and it continues seamlessly.

A full image editor

Layers, groups, masks, adjustment layers, layer styles, 41 filters, type and shapes. Open and save PSD files. Segment Anything selects a thing with one click - or from words: "the person's head".

AI that edits

Qwen Image Edit, FLUX Kontext and FLUX.2 Klein: regenerate a selection, remove an object, or Compose - put the dog from one layer on the sofa in another. Control layers guide every render.

A real timeline

Video, audio, image, text, 3D and path layers with keyframes, transitions and karaoke lyrics. Blender bridge for 3D. Compile it all into one film.

Music & sound

Write songs and covers, split stems, cut sound effects out of any video, lip-sync performers and build a music video scene by scene from the song.

Swap, perform, explore

Swap a character into a reference video, put a performer inside a 360° world, cut subjects out of a green screen and move them along a path.

Your layout, kept

Dockers float, snap and pin. ⊞ Docker configs remembers the sizes for every combination of dockers you open - and fits them to whatever screen you are on.

HOW IT FLOWS

From one prompt to a finished film

1 Write

Type an idea - or let the prompt chat and the screenplay writer turn it into scenes.

2 Cast

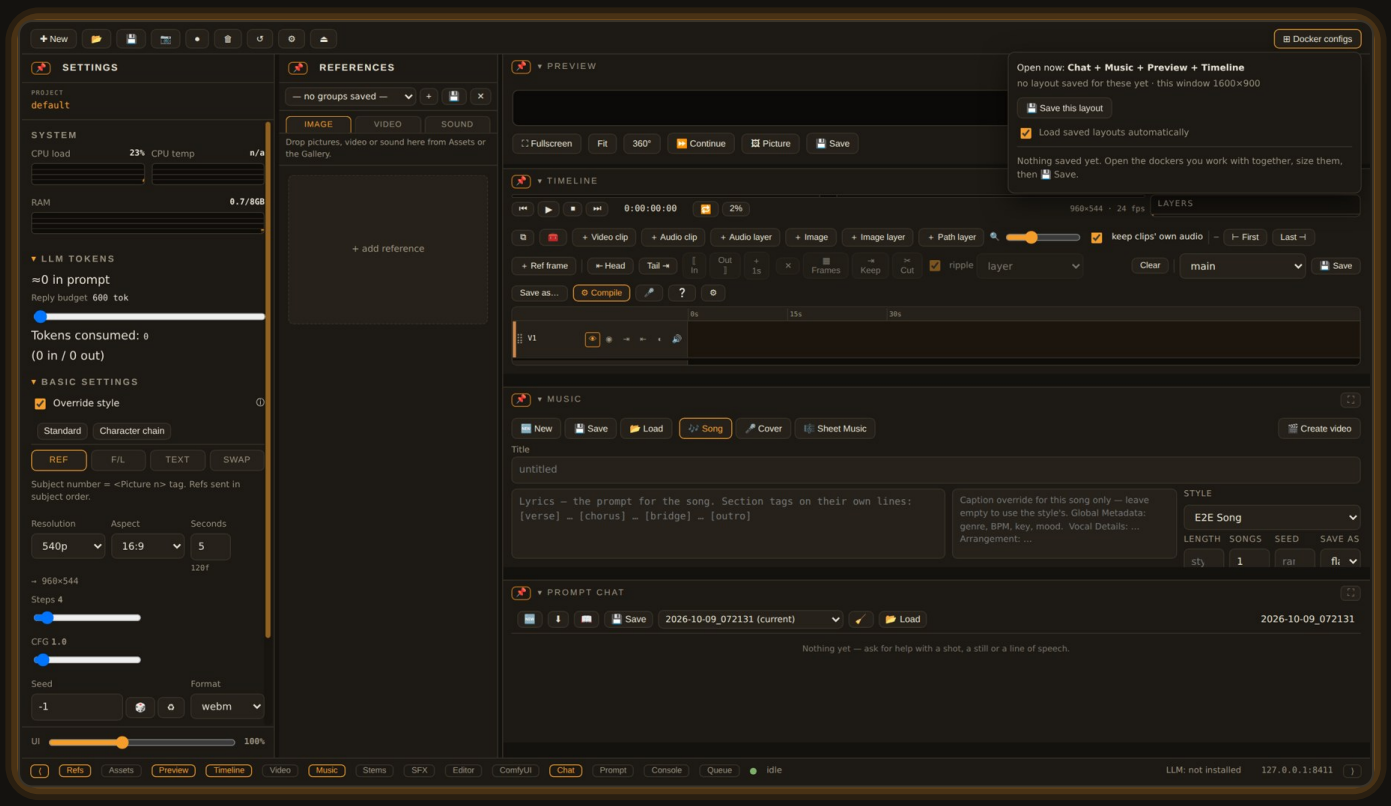

Make characters from one picture: a sheet, a voice, a look that holds across the film.

3 Render

Scene by scene on your own GPU, watching every step. Redo a take, keep the best.

4 Finish

Cut on the timeline, add music and lyrics, touch up stills in the editor, compile.

Your workspace, your way - open the dockers you need together, size them once, press ⊞ Docker configs ▸ Save. Next time they open exactly like that, on any screen.

Built for people who own their tools

- Runs on your own computer - your projects are plain folders on your disk
- Uses the ComfyUI and the models you already have, and local LLMs for writing
- No account and no sign-up - after the one-time model downloads it works offline
- Every docker sized the way you like it, on every screen you use

Install it. Open it. Make your film.
